

Polished concrete flooring

Polished concrete is a great option for modern flooring. It is durable, low maintenance and gives a sleek and high end finish to your project.

However polished concrete can be very cold in winter and the solution is to heat the floor. Floor heating is a low temperature heat designed to take the chill off the floor and gently radiate warmth into spaces above.

Floor heating is controlled by a floor sensing digital thermostat, ensuring the floor heating will never over heat.

INSTALLATION

Polished concrete can be installed in the slab or in the topping slab. At least 30mm coverage over the pipe is required to the finished floor surface.

SPECIAL REQUIREMENTS

Expansion joints are often installed in polished concrete floors. Comfort Heat must be informed of any expansion joints in the slab so provision can be made during installation.
